CLIENT INTEGRATION MANUAL

Architecture & Asset Management

01. Project Architecture

This template utilizes a scalable architecture. The SCSS logic is divided into partials (components and pages) to ensure that stylistic modifications remain isolated and manageable.

```
/template-root
  ├── /assets
  │   ├── /img        // Local image directory
  │   ├── /js         // Core interaction logic
  │   ├── /scss       // Source files (_variables, components, etc.)
  │   └── /css        // Compiled production stylesheets
  ├── index.html
  ├── archive.html
  └── case-study.html
```

02. Media Asset Management (Crucial)

To maintain optimal loading speeds and comply with international copyright standards, the default template utilizes high-performance Content Delivery Networks (CDNs) for placeholder imagery.

> **Note on Local Assets:** The `assets/img/` directory is provided empty by design. This is your dedicated repository for integrating proprietary brand imagery.

To replace the default CDN imagery with your local files:

1. Upload your optimized images (.webp, .jpg) to the `assets/img/` folder.
2. Locate the `<img>` tags or CSS background-image properties in the HTML files.
3. Update the source paths. For example, change `src="https://images.unsplash.com/..."` to `src="assets/img/your-image.jpg"`.
